Students in P2 were fascinated to learn that little banded penguins live under the equator in the Galapagos Islands! Possibly, long ago the emperor penguins moved up to the Galapagos Islands in a cold-water current called the Humboldt current and 'adapted' by becoming smaller and swimming in the water to keep cool!

Class 2 are truly a class of animal lovers! They can now recognise and name a huge variety of 'unique' and extraordinary animals that inhabit the Galapagos Islands. A huge well done to Class 2!!!

A student in Class 1 has a real passion for animals and for tubes. He particularly loves this basilisk that lives in the rain forests of Ecuador. We named our basilisk 'District' because he is green and long and thin. However, you would not want to get near a real basilisk. Basilisks eat anything that moves! They are also sometimes called 'Jesus Christ' because they walk on water!

In contrast to basilisks, iguanas look dangerous but they are very kind creatures that never kill and are vegetarians.

We have a student who loves to learn about birds. He loves all birds. We are very proud of him!
